Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Reference number: A37117; WUID:90337977; PMID:2143188
A;Contents: annotation; hementin cleavage site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Note: hementin, a protease from Haementeria ghilianii, the giant South American leech, C; Comment: The conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves ization sites responsible for the formation of the soft clot.

G; Comment: The soft clot is converted into the hard clot by factor XIIIa (fibrin-stabiliz ger) and between alpha chains (weaker) of different monomers.

C; Comment: All fibrinogen chains are synthesized in the liver.

"Characterization of a cDNA clone coding for the beta chain of bovine
                                                                                                                                                                                             SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulfide bonds. PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopetides A and B from alpha and beta chains and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIIA which catalyzes the epsilon-(gamma-glutamyl)lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different
 'Amino acid sequences of portions of the alpha and beta chains of

                                                                                                                                                                                                                                                            SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulface bonds. PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot. The soft clot is converted into the hard clot by factor XIIA which catalyzes the epsilon-(gamma-glutamyl)lysine cross-linking between gamma chains (stronger) and between alpha chains (weaker) of different

Exp. Cell Res. 169:47-56(1987).
-1-FUNCTION: Fibrinogen has a double function: yielding monomers that
polymerize into fibrin and acting as a cofactor in platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                eggregation.

--- SUBUNIT: Hexamer containing 2 sets of 3 nonidentical chains (alpha, beta and gamma), linked to each other by disulfide bonds.

--- FTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinogeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.

--- SIMILARITY: Contains 1 fibrinogen C-terminal domain.
                                                                                                                                               Rattus norvegicus (Rat).

    -!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
of DNA into RNA using the four ribonucleoside triphosphates as
substrates (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   {RNA}(N).
-!- SIMILARITY: Belongs to the phage and mitochondrial RNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
